

# SPAM DETECTION ON YOUTUBE COMMENTS

PRESENT BY: RIFQI ARRAYAN

## BACKGROUND

The YouTube platform has become one of the most popular mediums for digital content consumption. Many companies are utilising YouTube as an effective marketing tool to reach a wide audience. One aspect that is important for companies looking to advertise is maintaining their brand image and the effectiveness of their marketing campaigns. Spam comments under videos are a significant problem as they can ruin the user experience and reduce the value of the content, which in turn can affect the perception of the advertised brand.

in the picture on the side, I transformed the label (class) to change it from string data to numeric form so that it can be read by machine learning.

# DATA LOADING

```
class
1    175
0    175
Name: count, dtype: int64
```

```
Jumlah Train-Set : 245
Jumlah Test-Set  : 105
```

in the picture on the side I checked the number of labels or classes, where the class with label 1 (spam) is 175 rows and the class with label 0 (not spam) is 175 rows.

as well as displaying the amount of data included in the training set (train set) 70% and the test set (test set) 30%.

# VEKTORISASI

**SUBSCRIBE**

```
from sklearn.feature_extraction.text import CountVectorizer  
vect = CountVectorizer()
```

```
# Mempelajari kata apa saja yang ada pada `train_comment`  
vect.fit(train_comment)  
  
# Mengubah kata menjadi vektor berdasarkan frekuensi kemunculannya  
train_comment_mat = vect.transform(train_comment)  
test_comment_mat = vect.transform(test_comment) |
```

Convert words to vectors based on their frequency of occurrence, and use the transform method to convert test data and test data to numeric based on their occurrence.

# KLASIFIKASI

```
from sklearn.neighbors import KNeighborsClassifier  
knn = KNeighborsClassifier(n_neighbors=5)
```

```
knn.fit(train_comment_mat, train_class)
```

```
from sklearn.metrics import accuracy_score
```

```
hasil_prediksi = knn.predict(test_comment_mat)  
print('Akurasi : ', accuracy_score(test_class, hasil_prediksi))
```

```
Akurasi : 0.8952380952380953
```

performs classification with the K-Nearest Neighbors (KNN) technique by considering 5 nearest neighbours to determine the class of a data point and checking between The first parameter is the actual label, and the second parameter is the predicted label. with an accuracy rate close to 90%.

# NEW COMMENT TEST

```
komentar_baru = ["saya Rifqi arrayan sangat ganteng",  
                 "Subscribe to me for daily vines"]  
  
# Mengubah teks ke dalam bentuk vector  
komentar_baru = vect.transform(komentar_baru)  
  
# Memprediksi komentar baru  
hasil_prediksi_komentar_baru = knn.predict(komentar_baru)  
print('Hasil Prediksi : ', hasil_prediksi_komentar_baru)
```

```
Hasil Prediksi : [0 1]
```

in the picture beside I did a test on a new comment, where I tried a test with me 'Rifqi arrayan sangat ganteng' and the machine guessed that this comment was not spam (0) then I also tested with 'Subscribe to me for daily vines' and the machine guessed that this comment was spam (1)

# CONCLUSION

Spam detection analysis of YouTube comments is an important step for companies looking to advertise on the platform, as spam comments can ruin user experience and create a negative image for brands. Using machine learning techniques and natural language processing, companies can effectively identify and filter spam, maintaining the quality of interactions on the channels chosen for advertising. This ensures that the company's ads appear in a positive and relevant context, increasing audience trust and engagement, and optimising the effectiveness of marketing campaigns.

THANKS YOU
